Executive Summary

An important part of the FOSTER RAIL project is the monitoring of rail research activity. Previously, the rail sector did not know the market impact of previous research and a great deal of research funding has been wasted on research that has had no demonstrable impact. Therefore, the ERRAC Evaluation Working Group (EWG) has evaluated and continues to evaluate completed rail projects within WP6 of FOSTER RAIL project.

Meantime, considering the lessons learnt from previous project evaluations, the EWG proposes to monitor relevant ongoing projects (within task 6.1) and develop significant case studies (within task 6.3). This Deliverable outlines progress made to date (months 1 to 12) within Task 6.1 and 6.3 activities, and describes the activities on monitoring of relevant ongoing rail projects and case studies of previous rail research.

Section §3 presents both the overall WP6 methodology and the monitoring methodology. The activities defined within Tasks 6.1 and 6.3 are new for ERRAC Evaluation Working Group, requiring thus some preparation and pilot actions. The group aims to better define and improve these activities (i.e., monitoring of ongoing projects and development of case studies) for the duration of FOSTER-RAIL project.

The monitoring methodology is based on the analysis of relevant ongoing rail research project with respect to foreseen implementation and exploitation of results, according to initial objectives and contracted research work. A questionnaire was developed to facilitate the discussions with the project coordinators and better clarify all aspects relating to implementation and market uptake.

The monitoring activities are detailed in Section §4 and the recommendation letters sent for the projects which were analysed and discussed are attached in Appendix 1. The Evaluation Working Group has selected four relevant projects which were discussed in the 1st year. The monitoring process was completed for three of these projects.

The next section presents the approach and results related to ‘Case studies’. Three projects were selected to be further developed as case studies. ALJOIN project has already been analysed and presented as a case study, with focus on its implementation and market uptake. The presentation of ALJOIN for this scope, which is proposed to be used as a template for further case studies, is attached in Appendix 2.

Section §6 shows the dissemination activities related to the Evaluation Working Group results, including both the evaluation of past research and case studies.

The final section makes conclusions on the activities and results achieved within the first year of FOSTER-RAIL project, the lessons learnt being taken forward for further monitoring activities and development of relevant case studies, so that the EWG work would better support project coordinators towards implementation of results and market uptake.

From WP6, ERRAC Evaluation Working Group (EWG) has developed guidelines to provide ERRAC Work Package leaders, and others who are proposing research topics, activities and actions at National and European level, with the information needed to ensure strong market uptake. This has resulted in improvement in the impact of the rail research proposed by ERRAC.

Figure 2 ERRAC EWG monitoring methodology .................................................................. 8
1. Introduction

The Foster Rail project has been developed to assist ERRAC and other land-transport related ETPs to define future research needs for their strategies and programmes, so as to realise the Objectives of the Europe 2020 Strategy and work towards the aims of the White Paper 2011.\(^3\)

The CSA project itself comprises 8 Work Packages which, including project management and dissemination activities, interact to: enhance cooperation and communications between ETP, national platform and the Shift\(^2\)Rail Joint Undertaking, define the a rail business scenario for 2050, assess existing strategies and roadmaps, develop these further to contribute to 2050 strategy fulfilment, assess the strategic and innovative impact of previous and new funded projects and programmes in terms of market impact and uptake. Work Package 6 (WP6) “Monitoring to improve rail research innovation” undertakes specifically the final actions mentioned.

WP6 (in both current Foster Rail and previous ERRAC Road Map projects) supports the ERRAC Project Evaluation Working Group (EWG). It addresses the strengthening of the effectiveness of research and innovation capacities of the rail sector in Europe by determining the implementation of previous research and monitoring of rail research projects from relevant programmes.

The EWG has previously used the evaluation method developed to evaluate 66 projects from over 160 projects in the ERRAC rail projects database, which is continuously enlarging.

The EWG helps to identify, check and support proposals that clearly fill a gap in the roadmaps and support ERRAC strategy particularly for strategic proposals for the good of the sector.

Previously, the rail sector did not know the market impact of previous research and a great deal of research funding has been wasted on research that has had no demonstrable impact. This needed to change.

WP6 of Foster Rail aids this effort through 3 Tasks:

- **T6.1 Monitoring of Ongoing relevant Projects**
- **T6.2 Evaluation of Past rail projects**
- **T6.3 Case Studies**

Specifically, Task 6.1 focuses on the selection of 4 important ongoing projects per year and monitoring them to determine their progress towards the impacts considered within their initial grants.

Task 6.3 focuses on those chosen projects to develop 4 detailed case studies to determine best practice and also the barriers to market uptake and implementation. Alongside this, Task 6.3 will present the case studies at workshops and similar events to foster innovation aspects and highlight related issues.

Both Task 6.1 and 6.3 will be conducted over 36 months.

Deliverable 6.2 Report outlines progress made to date (months 1 to 12) within Task 6.1 and Task 6.3 activities. Good examples will be highlighted within FOSTERRAIL each year to M12, M24 and M36 with reasons for success, good criteria and best practice being identified.

---

\(^3\) “Roadmap to a Single European Transport Area - Towards a competitive and resource efficient transport system”
2. Objectives

One of the strategic objectives of FOSTER RAIL is to assess rail research projects from relevant research programmes. An important aspect of this is monitoring transport research projects in order to foster innovation and promote market uptake, innovation leading to implementation.

WP6 is dedicated to monitoring of transport research projects and organisation of workshops to foster innovation and market aspects. This WP addresses the strengthening of the effectiveness of research and innovation capacities of the rail sector in by monitoring of rail research projects to determine from all publicly funded transnational research which research activities can really been implemented and have a significant market impact. This process is based on an expanded version of the ERRAC Evaluation Working Group.

New project and programme monitoring activities are undertaken, to increase the visibility of research and innovation activities, and to contribute to the dissemination of research results. In addition to the traditional evaluations of potential market-uptake of finalised projects, a new monitoring dimension/perspective may enable a more proactive contribution of the Evaluation Working Group during on-going projects. Selected key on-going projects are being validated to determine and support their progress towards the impacts promised in the proposal.

This deliverable describes the progress with Tasks 6.1 and 6.3 of FOSTER RAIL, Deliverable 6.1 deals with Task 6.2 Evaluation of past rail projects.

- **Task 6.1 Monitoring of On-going relevant Projects**

  Uses published materials and selects 4 important projects per year that it believes will make a contribution to the railway sector. The list of selected projects was determined at the EWG kick off meeting, the projects selected were: D-RAIL, MARATHON, REFRESCO and MERLIN.

  Monitoring of these on-going projects is a voluntary basis. The objective is to determine their progress towards the impacts promised in the proposal.

  The EWG could assist with implementation strategies and exploitation routes. The activity started with an Initial project. The initial assessment has the following objectives:

  - determine how the projects’ goal and main objectives fit the ERRAC Roadmaps and, overall, the White Paper priorities;
  - consider the consortium composition and how stakeholders are represented within the project;
  - review the implementation plan and expected impact.

  ERRAC EWG then provides the consortium and the project officer with a letter of recommendations and other available information which may support the market uptake of the project outcomes.

- **Task 6.3 Case Studies**

  The objective is to work with the project champion to highlight the impact and assess the implementation within the rail sector against the implementation plans. Four in-depth case studies will be undertaken to determine best practice and also the barriers to market uptake and implementation. The first actual case studies were decided at the EWG kick off meeting and the strong examples are ALJOIN and SUSTAINABLE BRIDGES. The weak example selected to show barriers to implementation was INTEGRAIL.
3. **Methodology**

The overall EWG philosophy and WP6 methodology are summarised within below Figure 1.

*Figure 1 ERRAC EWG general methodology (past research, ongoing projects and case studies)*

Overall, the WP6 focuses on the following key activities:

- Monitoring of ongoing projects
- Evaluation of past research
- Case studies

In order to support the main above activities, WP6 has to carry out other activities, namely:

- Administration of ERRAC projects database;
- Dissemination;
- Coordination with project coordinators and the EC.

The monitoring methodology is summarised below in Figure 2
The monitoring of ongoing projects is a continuous process aimed to support key rail projects with respect to implementation of results and market uptake aspects.

The monitoring methodology comprises the following stages:

1. Using published and available materials, the EWG selects 4 projects per annum to be monitored;

2. The project coordinator is contacted by the EWG, the monitoring process is explained and he/she is invited to a meeting for this purpose. However, the monitoring is done on a voluntary basis, so project coordinators may refuse to take part to this process;

3. The project coordinator and/or project key partners meet the EWG and present the project with a focus on implementation and exploitation of results, as it was granted;

4. The EWG conducts an initial assessment to analyse project goal, consortium/ stakeholder composition and implementation impact, on the basis of: i. available documentation (e.g., project grant, deliverables, project website, etc.); ii. presentation given by the project representatives and subsequent discussion with them;

5. If the previous phase is not relevant enough for the EWG to make conclusions and provide recommendations, a questionnaire is used to better define the foreseen implementation and exploitation of project results (i.e., industrial application, technical harmonisation; to identify customer/ implementer and understand climate for implementation, etc.);

6. Considering the feedback from the initial meeting and the questionnaire, the EWG concludes the monitoring phase or asks for a 2nd meeting if some aspects are still unclear after steps 4 and 5;

7. The project representatives meet the EWG for the 2nd time if necessary to better clarify some details relating to the implementation of results or other key aspects (e.g., partnership, advisory groups, etc.);

*Figure 2 ERRAC EWG monitoring methodology*
8. Finally, the EWG concludes the monitoring phase with a set of comments and recommendations in relation to all the requisites for a successful implementation and market uptake. The EWG writes a letter including these comments and recommendations, which is further addressed both to the Project Coordinator and to the EC relevant representative (the Project Technical Officer).

The questionnaire developed by the EWG for monitoring of ongoing projects is presented below.

### 1. Defining the targeted implementation results in the project

**a. Industrial applications**

i. Technology / product / software  
ii. Business model  
iii. Process  
iv. Operations

**b. Input to technical harmonisation**

i. Technical Specification for Interoperability  
ii. Regulation  
iii. Standardisation

**c. Other – please specify**

### 2. Identifying the customer/implementer

**a. Who will fund the implementation?**

**b. Who will be responsible for the implementation?**

**c. What drives the implementation/investment?**

**d. Is there a secondary customer?**

**e. What is the targeted scale of implementation?**

### 3. Understanding the climate for implementation

**a. Who are the other major stakeholders impacted by the implementation?**

i. Financially  
ii. Politically  
iii. Other – please specify

**b. Are there regulatory issues influencing the implementation?**

**c. Are there funding issues influencing the implementation?**

**d. Relationship with potential interest groups positively or negatively impacting the implementation?**

### 4. Understanding the relevance of the consortium composition in view of market implementation

**Clarifying the ability of the consortium regarding the delivery of the expected results to the customer.**

i. Are all the categories of stakeholders necessary for a proper market uptake represented in the consortium?  
ii. To what extent does the project lead to proprietary solutions?

### 5. Understanding the process between the end of the project and the launch of market implementation

**a. Steps involved as part of the industrialisation of products**

**b. Requirements regarding certification of products or processes**
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>c.</td>
<td><strong>Requirements regarding retrofitting or modification of other assets and/or technical specifications/standards.</strong></td>
</tr>
<tr>
<td>d.</td>
<td><strong>All the supporting documentation, trainings, handbooks, etc.</strong></td>
</tr>
</tbody>
</table>

### 6. Understanding how this process should be managed

| a. | *Who will take responsibility to drive the process?* |
| b. | *Who will pay for it?* |
| c. | *Which other stakeholders need to be involved?* |

### 7. Recommendations to boost implementation

Ideally, an efficient monitoring process would mean that the EWG to meet and discuss with the representatives of relevant ongoing process twice, at critical times during the project period, namely:

- **1<sup>st</sup> monitoring phase** – after the start of the project, in the first 6 months, if possibly;
- **2<sup>nd</sup> monitoring phase** – prior to the project completion, in the final 6 months of the project.
4. Monitoring of ongoing projects

The main activity of Task 6.1 is the monitoring of relevant ongoing projects.

Over the lifetime of FOSTERRAIL and using published materials, ERRAC is selecting 4 important projects per year that it believes will make a contribution to the railway sector. The list of selected projects was determined at the EWG kick off meeting; those initially identified were D-RAIL, SPECTRUM, MERLIN, NODES and REFRESCO. On-going projects have volunteered to be monitored to determine their progress towards the impacts promised in their proposal.

Coordinators of chosen projects are invited to present their newly-started projects relevant to rail sector (preferable between month 6 and 12 of the project) for an initial assessment.

The initial assessment mainly analyses the following aspects:

- how the projects’ goal and main objectives fit the ERRAC Roadmaps and, overall, the White Paper priorities;
- the consortium composition and how stakeholders are represented within the project;
- the implementation plan and expected impact.

ERRAC EWG is also analysing the above aspects and providing the consortium and the project officer with a letter of recommendations and other available information which may support the market uptake of the project outcomes (related previous projects, contacts, etc.). This feedback is being formatted into a dedicated template which will be developed as part of the monitoring methodology.

Within 6 months prior to project completion, the coordinators of the chosen projects are invited to present the projects results. Where possible, ERRAC EWG is to invite representatives of stakeholders and third parties which may be interested in the project outcomes.

It was noted in the FOSTERRAIL proposal that the EWG could assist with implementation strategies and exploitation routes.

A summary of the monitoring activities of selected relevant projects is shown below in Table 4-1.

Table 4-1 Monitoring of Relevant Rail Projects

<table>
<thead>
<tr>
<th>Project</th>

<td>Meeting in the final phase.</td>
</tr>
</tbody>
</table>
The monitoring processes of D-RAIL and MARATHON projects have finalised with letters including the EWG comments and recommendations, which were sent to the project representatives and the EC project officer. The letters are attached within Appendix 1 EWG recommendation letters to projects’ coordinators and EC project officers. The monitoring of REFRESCO and MERLIN project are in the final phase.

For supporting the monitoring activities (both for the selected projects and in general, within broader dissemination events), the EWG has also analysed the approaches on Technology Readiness Levels (TRL) and Market Readiness Levels (MRL) in overall European Rail Research area. The EWG has further harmonised and adapted the ‘standard’ definitions, to be fully compatible with and suitable for the rail sector.

The definitions for TRL and MRL proposed by the EWG for railway innovation are presented below in Table 4-2.

Table 4-2 ERRAC EWG approach on TRL and MRL

<table>
<thead>
<tr>
<th>Technology Readiness Level (TRL)</th>
<th>Market Readiness Level (MRL)</th>
</tr>

<td>It is almost certain that customers will start implement the technology after initial demonstrators either because of strong business case or from obligations from standards or legislation or end customer demand (passenger).</td>
</tr>
</tbody>
</table>

The EWG aims to further extend this approach and develop a support tool to allow the researchers in rail sector to self-assess their own research initiatives and results.
5. Case studies

Within **Task 6.3**, the EWG is working with the project champions to highlight the impact and assess the implementation within the rail sector against the implementation plans.

Specifically, four in-depth case studies are being undertaken on four of the projects throughout their life, to determine best practice and also the barriers to market uptake and implementation.

The first actual case studies were decided at the EWG kick off meeting and the strong examples are ALJOIN and SUSTAINABLE BRIDGES. The weak example selected to show barriers to implementation was INTEGRAIL.

- **Case study: ALJOIN project**

ALJOIN project was initially developed as a case study template in line with the EWG recommendations and evaluation methodology. Its presentation included in Appendix 2. From the case study it can be seen that projects with a strong market uptake listed previously answered a clear need for a harmonized solution and had a clear and positive business case. Usually the project had no competition tensions with all the partners pulling in the same direction and as the research was pre-competitive it was without strategic issues between partners’ interests. The project clearly defined the ownership of implementation of project results, which were in the hands of one relevant stakeholder. This was an undivided business case. It is to the credit of the projects with strong market uptake they were able to convert results into international standards. As major users were involved in the initial requirements definition and assessment of results a broad consensus was established from the beginning. It is also clear that the project had the continuity and ability to build up results on its predecessor, expanding the scope and gradually solving problems in a systemic approach.

Using the ALJOIN Case study as an example, the key project drivers were the identified requirements to address the research needs and safety concerns over the performance of aluminium welds in rail vehicles. Recommendation 57 in the Rt Hon Lord Cullen PC Inquiry Report in the aftermath of the Ladbroke Grove accident stated:

In the case of new vehicles constructed of aluminium, consideration should be given to:

a) the use of alternatives to fusion welding;

b) the use of improved grades of aluminium which are less susceptible to fusion weld weakening; and

c) the further development of analytical techniques.

In addition with ALJOIN the actual implementation facilitated the impact assessment of the project and impact was assessed for safety, standards and from the scientific perspective:

- **Safety**

The results have improved the crashworthiness of aluminium rail vehicles and as such, can contribute to a reduction in fatalities and injuries in potential future accidents involving this type of vehicle. According to DfT’s Highways Economics Note No. 1, the value of preventing a statistical fatality is £1.428m (2005 prices); There were 31 fatalities in the Ladbroke Grove accident. Therefore, the cost of this research (£1.37m) is less than the statistical value of 1 fatality.

- **Standards**

The output from ALJOIN has directly contributed to 2 European Standards, EN 15085 "Railway applications - Welding of railway vehicles and components" and EN 15227, "Crashworthiness of Rail Vehicle Bodies".
• **Scientific**

The study has improved the fundamental understanding of the issues related to aluminium structures for rolling stock. 2 Journal papers, 2 specialised publications and 9 conference papers have been produced. A dedicated International Conference on Aluminium Crashworthiness held at the National Railway Museum in York on 07 September 2005. The work has received 2 prestigious awards: IMechE safety and railway innovation.

From the ALJOIN Case Study the following lessons were learnt:

• There was industry recognition of a problem affecting the core of their business and their commitment to find a solution drove the success of the project. In this case the safety concerns were particularly critical for modern rail vehicles using aluminium.

• A coordinated response to a research need identified as a consequence of a tragic event led to the understanding of fundamental issues related to Aluminium joining technologies and their crashworthiness. This emphasized that a strong need for research is beneficial to success.

• The quality of the work also contributed to the success of the project as has the dissemination of its result beyond the lifetime of the funding. This is an important lesson that shows that results from research cannot be self-promoting and appropriate post-project dissemination is critical to maximise the benefits.
6. Dissemination of results

Also within Task 6.3, work is underway to scope and organise workshops to foster innovation aspects and highlight implementation related issues such as IPR, licenses, funding etc.

The most relevant activities in this direction are listed below.

1. Presentation of case study (ALJOIN) at Horizon 2020 information and networking day, London, 8th November 2013;

2. Presentation of EWG approach with respect to Technology Readiness Levels (TRL) and Market Readiness Levels (MRL) in railway innovation at the ERRAC Plenary, Brussels, 15th November 2014;

3. Presentation of EWG activities and results at the SPECTRUM Project General Assembly and Workshop, Newcastle, 21st May 2014;

4. Paper on EWG activities and results, and oral presentation at TRA2014 Transport Research Arena 2014, 14-17 Apr 2014, Paris:

   “Monitoring of rail research projects to improve market impact and implementation”

   Mark Robinson, Dan Otteborn, Cristian Ulianov
7. Conclusions and way forward

Monitoring of projects is a proven method for strengthening of the effectiveness of research and innovation capacities of the rail sector in Europe by promoting the innovation in on-going projects and learning the lessons of previous research. There is no Innovation without Improvement and Implementation.

FOSTER-RAIL takes responsibility for the changing needs and innovations for Research and Technological Development in the rail sector. In addition it should evaluate the impact of its activities with the aim of facilitating and managing the better implementation of the priorities set by the SRRIA, keeping in mind the transport research priorities as described in the FP7 Transport Work Programme and Horizon 2020. Its work will support European Union initiatives, in both the Transport Policy and Industrial domains.

The main impact will be a strengthened cooperation of all minor and major stakeholders involved in rail transport and urban mobility in Europe whereby it will be possible to reach the goals stated as objectives, such as value for money and increase the use of the railways by enhancing its’ competitiveness in all respects, at the same time enhancing the competitiveness of the European rail industry, by the promotion of rail research and technological, scientific excellence together with investment in rail infrastructures in an enlarged Europe (and considering those beyond the EU borders).

The impact of research activities should be evaluated on the basis of performance criteria of this mode of transport, its transport means, rolling stock, its infrastructure and its supportive facilities. One important characteristic cuts across all the European railway businesses: the European railways need to provide improving value for money for more attractive rail services. In some cases that will be necessary to provide funds for re-investment; in others it is a necessary condition for survival. To ensure that the railways deliver better value for money must, therefore, be at the heart of the research programme and this can only be achieved by monitoring.

FOSTER-RAIL provides a vision of rail research in order to increase the attractiveness of investment rail research, as the promoters of research in railway transport will be increasingly aware market uptake through evaluation (WP6) and therefore of the benefits in terms of the improvement of their rail transport system and to their transport networks as a whole.

Future workshops and plenaries should make it clear that:

1. Projects should search for viable solutions in terms of applicability and cost implications, and develop real business cases;
2. There is a real need to think of future market uptake and what happens after project ends: the project as an enabler and not an end to itself;
3. Scope, inputs and deliverables should be clearly defined at project at inception;
4. Ownership of project results and deliverables should be clarified at inception;
5. The project needs committed partners really interested in finding and applying viable solutions (e.g. for new products, involve companies that actually make them to avoid barriers to implementation);
6. Possible problems/ barriers to implementation should be considered to avoid split of interest and weak market uptake, taking account of implications for strategic interests of key players to avoid strategic, commercial, technological and operational constraints (e.g. not to devise technical solutions that incur extra costs to another party, without involving them);
7. The project should set-up a Steering Group of experts/stakeholders familiar with context at play, to be in charge of advisory aspect and exploitation of results once the project has ended;
8. There is a need to plan for knowledge retention and dissemination at inception;
9. Clear communication channels and frequency of exchange should be encouraged;
10. A regular review on post-project progress (possibly electing a project responsible/promoter) should be conducted.

RECOMMENDATIONS FROM ERRAC EVALUATION WORKING GROUP (EWG)

To: D-RAIL consortium

Subject: Feedback from D-RAIL project pre-evaluation on 31st May 2012, CER Brussels

D-RAIL ("Development of the Future Rail Freight System to Reduce the Occurrences and Impact of Derailment") is a 3 years FP7 funded project which started in 2011 and is jointly coordinated by the International Union of Railways (UIC) and Newcastle Centre for Railway Research (NewRail).

D-RAIL consortium, represented by Bjorn Paulsson (UIC) and Gordana Vasic Franklin (NewRail), has presented the structure of the project, the first outcomes and planning of future activities as well, to the Evaluation Working Group of ERRAC on the 31st May 2012, at CER Brussels.

Considering the project's objectives, planning of work and future challenges, the Evaluation Working Group has analysed its potential with respect to the implementation of results and market uptake. As a result the EWG would like to make the following recommendations to D-RAIL consortium:

➢ Some commercial aspects should be better addressed to justify further investments in technology developed for reducing the occurrence of derailments (example: the cost of such investments might be higher than derailments' cost).
➢ The project has a consistent and experienced partnership and a good knowledge of the state of the art of derailments problem. However, considering the large number of related projects, a permanent communication of results and update of information is needed between all these ongoing projects.
➢ Some basic instruments for the implementation of results are mentioned in WP8 of D-RAIL. However, the EWG considers that the implementation process would be more efficient if a supplementary dedicated workpackage would be added, i.e. “WP9 Implementation support”. Since the new framework programme “Horizon 2020” prioritises the implementation of results, providing supplementary funds for this purpose, the EWG suggests that D-RAIL could request funds for a new workpackage to deal with implementation issues.
➢ Considering D-RAIL partnership it was observed that most of the implementation support is expected from Infrastructure Managers. EWG recommends to D-RAIL
European Rail Research Advisory Council

consortium to address this gap, eventually by initiating a collaboration with the International Union of Wagon Keepers (UIP) – Mr. Holger Segerer (Holger.Segerer@uiprail.org) from UIP was recommended as contact person on behalf of EWG (Dan Otteborn).

➢ The European Railway Agency (ERA) should be permanently updated with the project's results and consulted on potential possibilities of implementation (e.g. is ERA prepared to mandate the onboard monitoring equipment; who will support the investment?).

➢ The work to be carried out in WP3 and WP4 should analyse and make the difference between various monitoring systems (on loco/ on train/ on each wagon, infrastructure/ rolling stock onboard systems, etc.). Business cases should analyse and define which stakeholders will support the costs for each different system (divided business cases are difficult and risky – to be taken into consideration). D-RAIN consortium should also take care of issues regarding the testing of novel solutions before these are proposed for implementation.

➢ Overall, the investment issues are considered to be the most sensitive and critical for the implementation of D-RAIN results. Therefore, the partners should focus and address these issues in advance.

The EWG were very impressed with the D-RAIN project and commend their initiatives and approach to towards implementation. D-RAIN are unique in preparing for implementation and writing this EWG coordination into the description of work. This 2 way communication could be helpful both for project coordinators in improving the implementation activities, and for the EWG to enhance its activity and disseminate its knowledge. Therefore, the EWG would like to encourage other project coordinators to get involved in such pre-evaluation process as well.

Re: ERRAC Evaluation Working Group - FOSTER RAIL  
Task 6.1 Monitoring of Ongoing Relevant Projects  
MARATHON FP7 project

Dear Sirs,

In accordance with FOSTER RAIL, Project number 605734, contractual obligations, work package 6. The Evaluation Working Group is entrusted to select and monitor relevant ongoing projects (Task 6.1) and formulate an opinion on these projects in the following areas:

A. How the projects’ goal and main objectives fit the ERRAC road map and, overall, the white paper priorities.

B. The consortium composition and how stakeholders are represented within the project.

C. The implementation plan and expected impact.

D. Progress towards the contractual obligations in regards to impact.

E. Recommendations on how to increase the market up-take and consequently the impact.

Work Package 6 Evaluation Working Group have now completed the first on-going project monitoring session for MARATHON and concluded the following:

**A. How the project goal and main objectives fit the ERRAC road map and, overall, the white paper priorities**

The Marathon overall objective is “To improve the performance and appeal of rail freight service for the customer”.

The Evaluation Working Group is of the opinion that:

The objectives of the MARATHON project are perfectly in line with the ERRAC roadmap and the priorities of the white paper.

ERRAC Evaluation Working Group Chairman  
Dan Otteborn

FOSTER RAIL WP06: Monitoring to improve rail research innovation  
www.errac.org
B. The consortium composition and how stakeholders are represented within the project.

The consortium consists of 19 partners representing relevant freight traffic operators, freight forwarders, manufacturing industries, universities and branch organisations.

The Evaluation Working Group is of the opinion that:

The consortium is well constituted and well suited for performing the project aims including market uptake of results.

C. The implementation plan impact and expected impact

The project has its focus on the following five main drivers:

- Rail freight capacity increase.
- Increase in commercial speed for freight trains for accessing higher value slots for better services to the customers
- Traffic bundling for economies of scale: standard trains can easily be assembled disassembled as market conditions and operational circumstances may require
- Operating cost reduction
- Energy savings and sustainable mobility

The reduction of operational cost is estimated between 30 to 50% by introduction of faster, longer and heavier trains.

The Evaluation Working Group is of the opinion that:

- Unlike most other EU financed research projects the MARATHON project includes work packages directly aimed at securing market uptake. These are WP 1 Market uptake, WP 4 Business case simulation and evaluation. The deliverables include a proposed TecRec, which is a forerunner of an EN standard and additionally a handbook describing the handling and use of the system.
- The above described elements of an implementation plan are supported through the impressive full-scale demonstrators.
- The expected impacts are substantial not only in terms of direct cost reduction but also from the fact that additional capacity could eliminate or postpone very expensive investment in building of new lines, while providing such capacity in much shorter time as required by the market place.

D. Progress towards the contractual obligations in regards to impact

A full-scale demonstration was performed on January 18 by running a MARATHON train between Lyon and Nimes in France. Data accumulated during this full-scale demonstration strengthens the belief in achieving the 30 to 50% cost reduction. During the Trial it has been

Re: ERRAC Evaluation Working Group - FOSTER RAIL
Task 6.1 Monitoring of Ongoing Relevant Projects

REFRESCO FP7 project

Dear Mr. Rogge,

On behalf of the ERRAC evaluation working group (FOSTER RAIL WP6), I am contacting you regarding the ERRAC activities on the evaluation of ongoing research projects.

As you may be aware, ERRAC has been successfully evaluating past research projects since 2006. In 2013, the ERRAC Evaluation Working Group, in the framework of the FOSTER RAIL project, launched an activity on monitoring ongoing research projects.

I am therefore happy to send you the first report of the group further to the evaluation of the project REFRESCO.

I am looking forward to hearing from you soon. The ERRAC evaluation working group remains at your entire disposal for further information.

Yours sincerely,

Dan Otteborn
Chairman ERRAC Evaluation Working Group
European Rail Research Advisory Council

ERRAC Evaluation Working group

FOSTER RAIL - Monitoring to improve rail research innovation - Monitoring of ongoing projects

REFRESCO - “Towards a REgulatory FRamework for the use of Structural new materials in railway passenger and freight CarBoDysshells” (Grant Agreement number 605632).

Coordinator: Ross Hanley, UNIFE (ross.hanley@unife.org)

Project Officer: Ludger Rogge, DG Research and Innovation

In accordance with the FOSTER-RAIL project (Grant Agreement number 605734), the partners of the ERRAC evaluation working group (FOSTER RAIL WP6) are responsible for monitoring relevant on-going projects (Task 6.1) and formulating an opinion on these projects in the following areas:

A. The consortium composition and how stakeholders are represented within the project.
B. The implementation plan and expected impact.
C. Progress towards the contractual obligations in regards to impact.
D. Recommendations on how to increase the market up-take and consequently the impact.

The Evaluation Working Group has now completed monitoring of the second on-going project REFRESCO and concluded the following:

A. How the project goal and main objectives fit the ERRAC road map and, overall, the white paper priorities.

The overall objectives of REFRESCO are to “set the framework for the implementation of new materials in the railway sector through the evolution of certification process for rolling stock. REFRESCO will generate recommendations and provide the information needed to adapt the regulatory framework of railway carbody structures to the introduction of new materials.”

The Evaluation working group is of the opinion that the objectives of the REFRESCO project are perfectly in line with the ERRAC priorities and objectives as well as with those of the European Commission’s White Paper¹.

ERRAC Evaluation Working Group Chairman
Dan Otteborn

FOSTER RAIL WP06: Monitoring to improve rail research innovation

www.errac.org
B. The consortium composition and how stakeholders are represented within the project.

The consortium consists of 18 partners gathering manufacturers, railway undertakings, universities and sector organisations, including one certification body.

The opinion of the evaluation working group is the following:

- The involvement of more certification bodies could be foreseen to further guarantee the wide acceptance of the project results.
- As the project intends to influence the regulatory framework, the involvement of the European Railway Agency, CEN, CENELEC and National Safety Agencies in the REFRESCO Advisory Council was already foreseen at project inception and is already running.

C. The implementation plan impact and expected impact

As the implementation of the project results relies on the success of the development of new lightweight materials which is not part of the scope of REFRESCO (they will be developed at a further stage in another initiative), the overall market uptake also depends on the success of the developments to come.

The Evaluation working group is of the opinion that:

- REFRESCO will be able to propose new ways to certify new materials and propose modifications to existing legislation. The real impact should be realised if the results of REFRESCO are combined with research development as well as market acceptance of new lightweight materials on the market.
- Since REFRESCO is engaged (in WP2) in the identification of potential suitable new materials, the ERRAC Evaluation Working Group suggests the project should consider cost efficient solutions (materials, processes and maintenance) as factors in searching for new suitable lightweight materials.

D. Progress towards the contractual obligations in regards to impact of the project:

The ERRAC Evaluation Working Group is of the opinion that REFRESCO will succeed in its contractual obligations. However, the group would like to reiterate that the overall market uptake of the project will depend on the success of other projects outside the control of REFRESCO.
E. **Recommendations on how to secure and increase the market up-take:**

The Evaluation working group is of the opinion that:

- The project should try to actively involve more certification bodies. The REFRESO Advisory Council is however already a good framework for involving external regulatory partners.
- The project should consider cost efficient solutions (materials, processes and maintenance) as factors in searching for new suitable lightweight materials.
- The project should use EN Standards as a final delivery as much as possible.

Appendix 2  Case studies

➢ ALJOIN Project

Case study - Project “ALJOIN”

Crashworthiness of joints in aluminium rail vehicles

George Kotsikos
NewRail | Newcastle University | UK.
Content

- Background
- Development of the ALJOIN Project
- Project description
- Lessons learnt

Background

- Aluminium alloys: Lightweight, corrosion resistant, weldable.
- Earliest applications of aluminium in rail coach design in 1935.
- First aluminium monocoque bodyshells were designed in the 70s (APT, TGV)
- Large closed cell extrusions.
  - Design versatility
  - Superior surface finish
  - Superior collapse strength and impact resistance in the longitudinal direction
Background

The Ladbroke Grove Accident

5th October 1999, 21 fatalities and 400 injured

Background

‘...the aluminium extrusions had fractured along the weld lines and there was a lack of plastic deformation (...) the structure appeared to have failed along the welds rather than deforming in a controlled manner’

Cullen Report

The catastrophic failure of welds in this manner is a phenomenon known as ‘weld-unzipping’.
Background

- Weld unzipping - dynamic ductile tearing of the weld metal or heat affected zone is known to materials engineers.
- The process is controlled by:
  - Geometry of applied stresses/crack trajectory
  - Plastic deformation at the crack tip
  - Material composition
  - Impurities
  - Microstructure
- Fusion welding can be critical in localising failure as it affects microstructure, mechanical properties and can introduce defects.
- Aluminium alloys are sensitive to heat input introduced by the fusion welding processes.
  - Proof strength of 6005A HAZ ~ 50% parent plate
Project development

• A detailed research programme of work was necessary to provide a solution to **eliminate weld unzipping** in aluminium rail vehicles.

• How? (definition of intermediate objectives)
  – Provide physical evidence of the energy absorption capability of aluminium alloy welds by testing;
  – Assess the adequacy or inadequacy of current design and construction practices of aluminium alloy welds in the context of crashworthiness;
  – Investigate alternative welding techniques and/or joint designs for improved impact performance of aluminium alloy joints;
  – Development of the material constitutive modelling for the parent material and the welds;
  – Numerical modelling of simple joints subjected to quasi-static and dynamic loads;
  – Develop numerical modelling techniques for simulation of crashworthiness of full rail vehicles.

Project development

• Partner selection
  – Can it be done by a single organisation? NO
  – Wide ranging expertise required? YES
  – Is industry/end user involvement important? YES
    • Rail coach manufacturer(s)
    • Materials supplier(s)
  – Welding/joining specialists required? YES
  – Modelling experts required? YES
  – Academic expertise required? YES
  – Specialist test facilities required YES
Project development

- FP5 - FP5-2002-GROWTH – Competitive and Sustainable Growth

- Key Action 3, Land Transport and Marine Technologies

- Strategic Objectives
  - Improved fuel efficiency and reduced emissions - cutting CO₂ emissions and developing and validating zero-emission vehicles.
  - Improved performance - increasing safety, reliability, maintainability, availability, operability, energy efficiency and adaptability.
  - Improved system competitiveness - reducing both time to market and development costs.

- Priority 2: Technology integration and validation
  - Research will focus on integrating and validating six technology platforms:
    - New land transport vehicle concepts; enhanced systems efficiency, Advanced concepts for ships and vessels; competitive shipbuilding, Enhanced design and manufacturing for road vehicles, sustainable and modular trains, Safe, efficient and environmentally friendly vessels and platforms, Efficient interoperability and transhipment.

ALJOIN project overview

• The project concept constituted of 5 distinct parts:
  – Mechanical characterisation of joints (MIG, Laser MIG, FSW, bonded, bolted)
  – Fracture mechanics analysis
  – Impact tests on full size components
  – Solution development and validation
  – Modelling and collision simulation
Mechanical property characterisation

- Material supplier partner manufactured full scale closed cell extrusions for assessment.
- Same extrusions also used for impact tests.
- MIG and Laser MIG welded extrusions were produced with two types of filler wire; Al-Si (existing consumable), Al-Mg (proposed alternative consumable).
- Bonded Bolted and FSW extrusions used slightly modified type of extrusions.

Academic partner undertook material characterisation work

- Use of Al-Mg filler produces welds with improved mechanical properties over Al-Si filler
- Hardness variation across the weld is similar

<table>
<thead>
<tr>
<th>Material</th>
<th>Charpy impact energy (J)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent plate</td>
<td>0.73</td>
</tr>
<tr>
<td>Weld – (Al-Si filler)</td>
<td>0.32</td>
</tr>
<tr>
<td>Weld – (Al-Mg filler)</td>
<td>0.56</td>
</tr>
</tbody>
</table>
Fracture mechanics

Static and dynamic J-R curves were obtained through SENB tests for the parent material and weld region.

Fracture mechanics

- Fracture mechanics tests using a modified SENB specimen design and a CCT specimen were.
- The analysis used the Energy Dissipation Rate (EDR) approach.
- The tests provided information such as tearing resistance index (T) and critical CTOA and were intended to aid with numerical modelling of tearing process in the welded aluminium extrusions.
Fracture mechanics

- **Al-Mg filler**
  - $D=1170 \text{ kJ/m}^2$
  - $T= 0.03$

- **Al-Si filler**
  - $D=350 \text{ kJ/m}^2$
  - $T= 0.011$

---

Full scale impact tests

- Dynamic tear tests on full scale welded extrusions were carried out by the industry partner’s facility.
Full scale impact tests

Laser MIG

FSW

MIG

All welds failed by weld unzipping!

Solution approach

• What matters when a collision takes place is whether the structure spreads the impact energy or concentrates it in a specific region (the weld in this case).
• Fusion welding in aluminium alloys results in an “undermatched weld”.
• The impact energy in a structure with a strength undermatch, may channel all the energy to the weld region. This will have to be taken up by the energy dissipation rate which implies extensive crack growth.
Solution approach

• Reducing the heat input
  – Laser MIG
  – FSW
  – Bonded joints

• Change joint design
  – Altering weld geometry by thickening the plating at the weld region

Failures away from weld with the exception of Laser MIG welds
Modelling weld failure

- Detailed mechanical property characterisation was used for modelling activities.
- Detailed FEA models were prepared and validated against component tests.
- Code used LS-DYNA
- Failure criteria used:
  - Maximum strain failure model
  - Gurson-Tvergaard model
Collision modelling

- A Finite Element model of a class 165DMU similar to that involved in the Ladbroke Grove accident in the UK was created (undertaken by research institution partner specialising in FEA modelling)
- Simulation of collision at 20m/s (72km/h) on a solid flat surface.
- The simulation is repeated with the new joint design and consumable

Train collision simulation – Standard weld design
Train collision simulation – Standard weld design

Train collision simulation – modified joint (section thickening)
Train collision simulation – modified joint (section thickening)

Project output

- ALJOIN provided a solution to the problem of “weld unzipping” for welded aluminium closed cell extrusions.
- Contributed to the development of two industry standards;
  - EN 15085 "Railway applications - Welding of railway vehicles and components"
  - EN 15227, “Crashworthiness requirements for railway vehicle bodies”
- Contributed to the enhancement of safety for rail passengers and staff.
- The solution does not introduce a significant economic penalty to industry.
- Results have a Europe wide (if not global) impact.
- Contributed to the enhancement of knowledge to academia, research institutions and industry partners.
Lessons learnt

- Project idea
- Clear definition of main objective and expected outcomes
- Well structured work programme with clearly identified deliverables
- Definition of partners and their roles – include essential end-users of the results
- Partnership should include "champions" to promote implementation after project end

THANK YOU
